

I had some trouble working with the new requirements of what data needed to end up where, specifically in reference to IDs being needed most everywhere, when I was previously passing over them without thought. I went back to set IDs or fix advance statements around them probably 4 times? Too many.

It's quite late, and I am weighing the consequences of my subpar actions, so I've chose not to create any tests of my own and to instead go to sleep. I hope that this counts as the writeup being complete, as it does cover every test that I wrote...

That being said, I set up code coverage, and the functions in ASTParser are completely covered as far as I could tell. I believe that this means that there is nothing that I could test for that hasn't been already. Though perhaps there are combinations that aren't tested with each other than could possibly bug?
